

日本学術振興会 先端学術研究人材養成事業
学術講演会

題 目 Exploring the interface between heterogeneous and
homogeneous catalysis
講演者 Sir John Meurig Thomas
(Department of Materials Science, University of
Cambridge, UK)
日 時 2010年2月12日 10:00-11:00
場 所 東京大学工学部五号館1階 52号講義室
共 催 北海道大学触媒化学研究センター、
東京大学 GCOE 理工連携による化学イノベーション

Recent advances in structural characterization have prompted many students of catalysis to argue that the distinctions between heterogeneous and homogeneous catalysts are becoming increasingly blurred. The situation has further prompted certain investigators to enunciate the following statements, each of which will be adumbrated during the course of the talk:

- 1. The scope for introduction multifunctional catalysis is greater with heterogeneous than with homogeneous catalysts.**
- 2. The nature of active sites in homogeneous and heterogeneous catalysts is very different.**
- 3. Certain chemical transformations can be effected efficiently only with heterogeneous catalysts.**
- 4. Many homogeneous catalysts may be immobilized at the surfaces of, or intercalated within, solids and often yield superior performance.**
- 5. Spatially isolated and readily accessible single-sites on nanoporous supports unite the advantages of heterogeneous and homogeneous catalysts.**
